Practical No 3

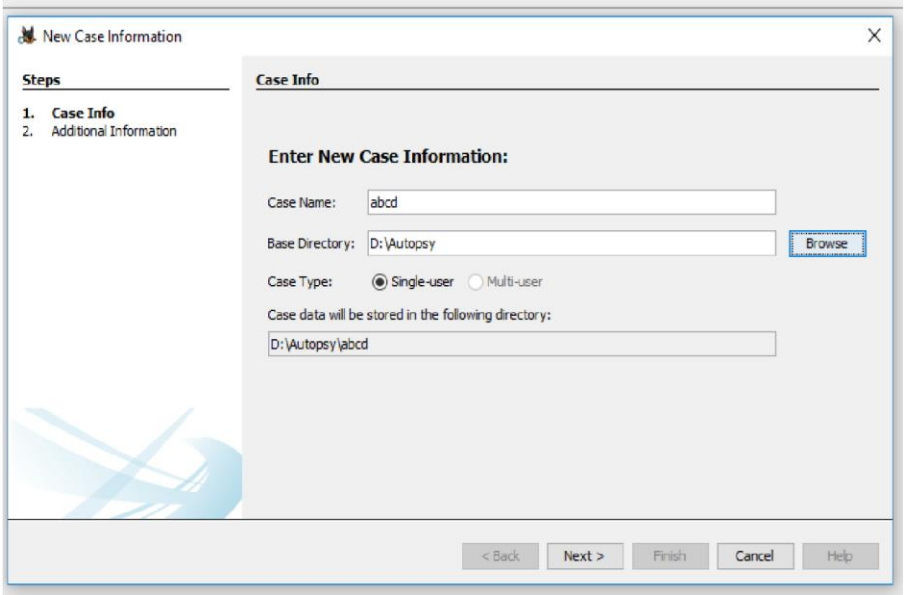
Aim: Forensics Case Study:

- Solve the Case Study (image file) provided in lab using Autopsy.

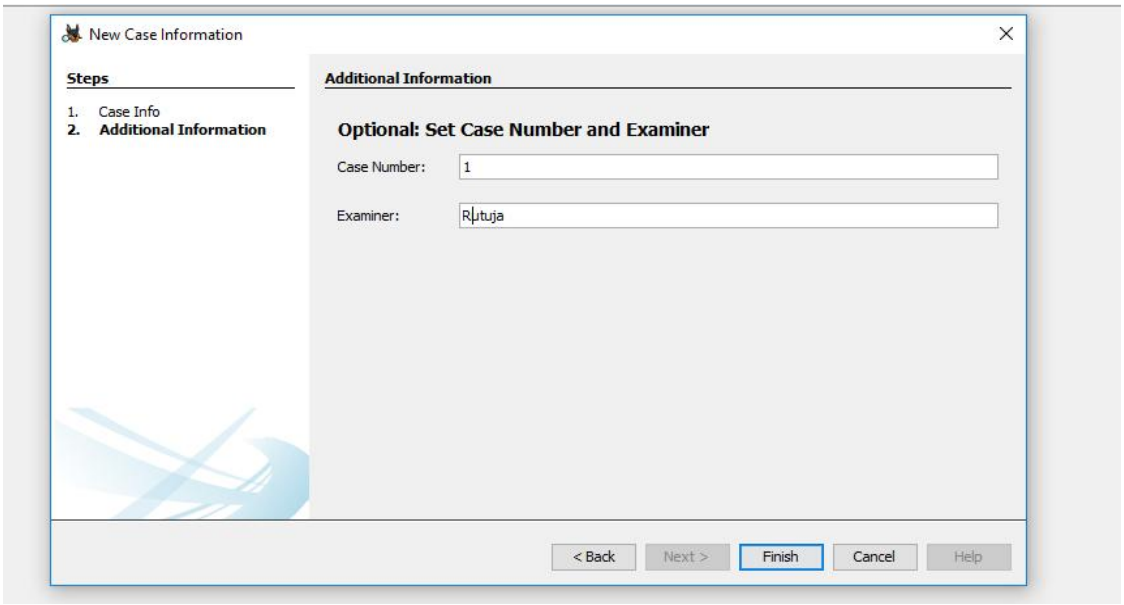
Steps:

1. Start Autopsy.
2. Select “Create New Case” option.

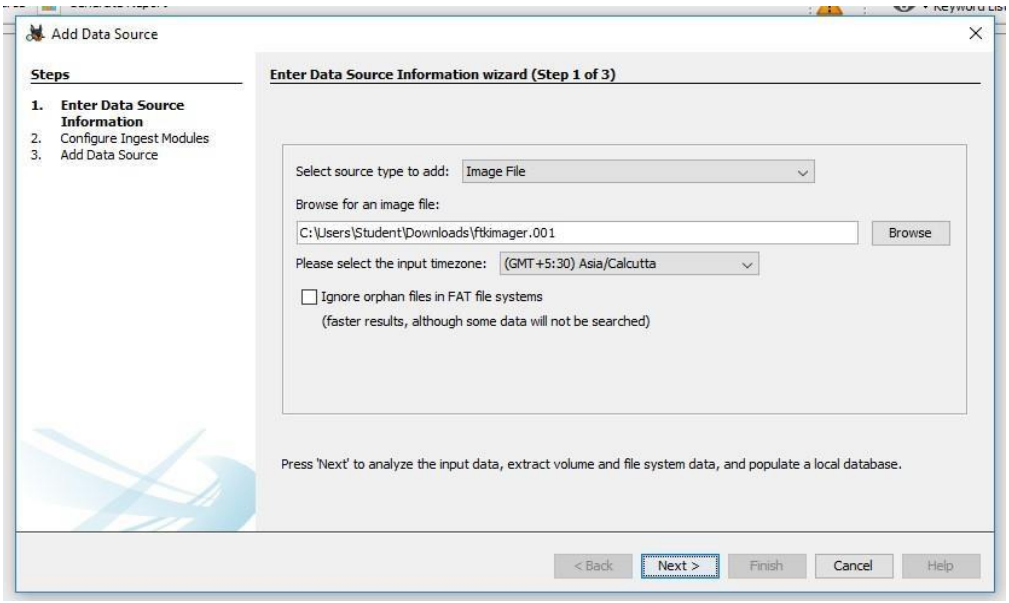
3. Enter the case related information. In base directory provide the path where you want to save the recovered files and report. Click on Next.



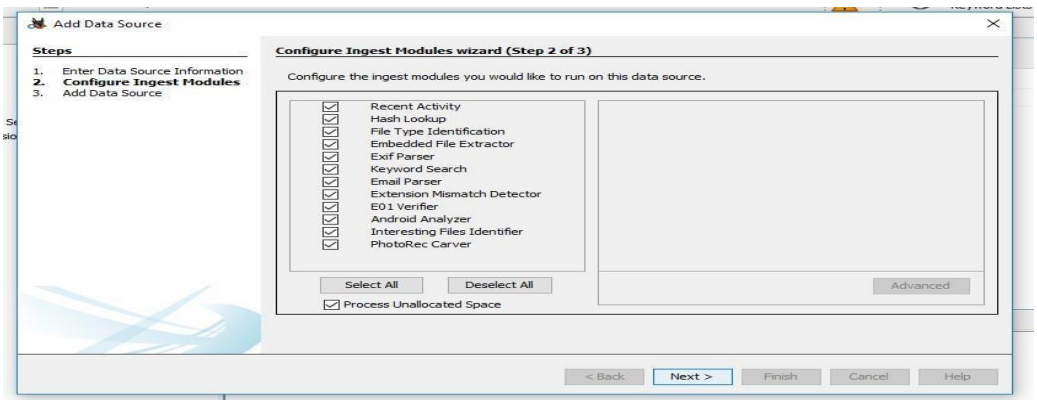
4. Now, provide some additional information and click on Finish.



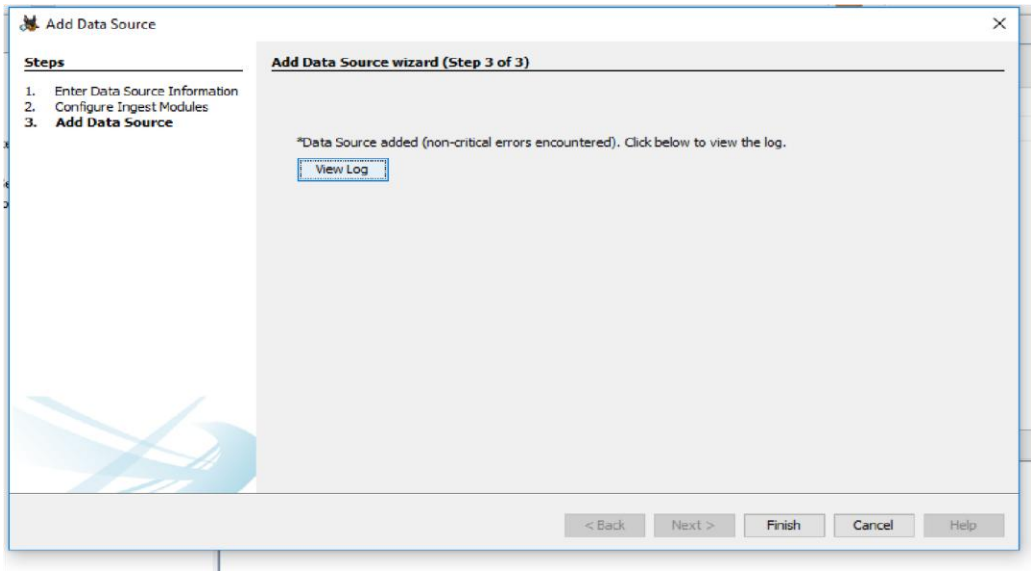
5. Enter the data source information. Select the source type to add as Image file and provide the proper image file path. Click on Next.



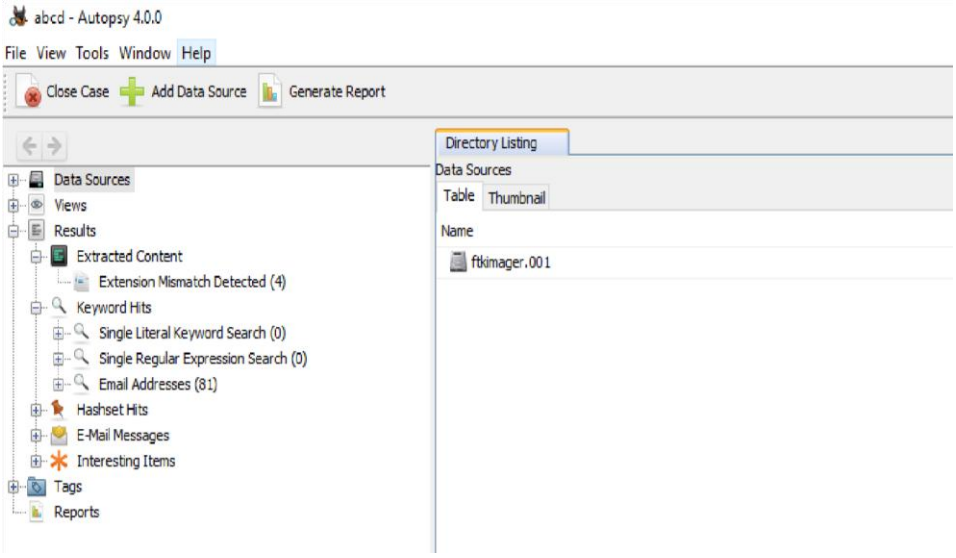
6. Now, click on select all and then Next.



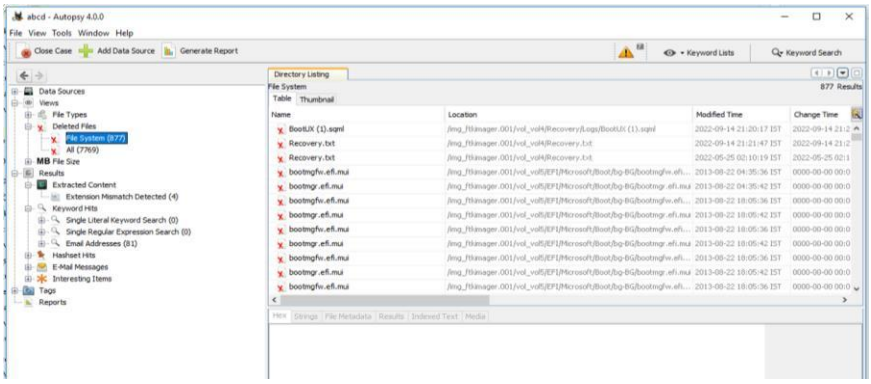
7. After performing the above step, the below screen will appear. Click on Finish.



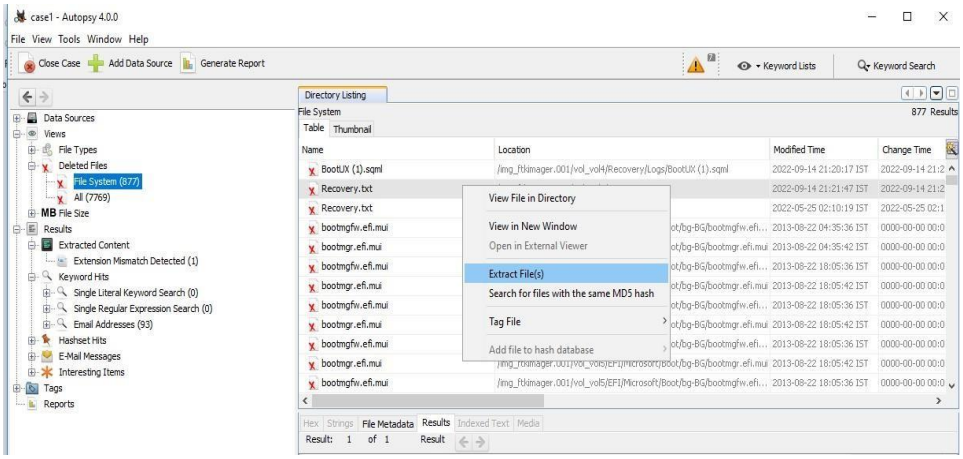
8. In the right pane you will be able to see the image file which you have added.



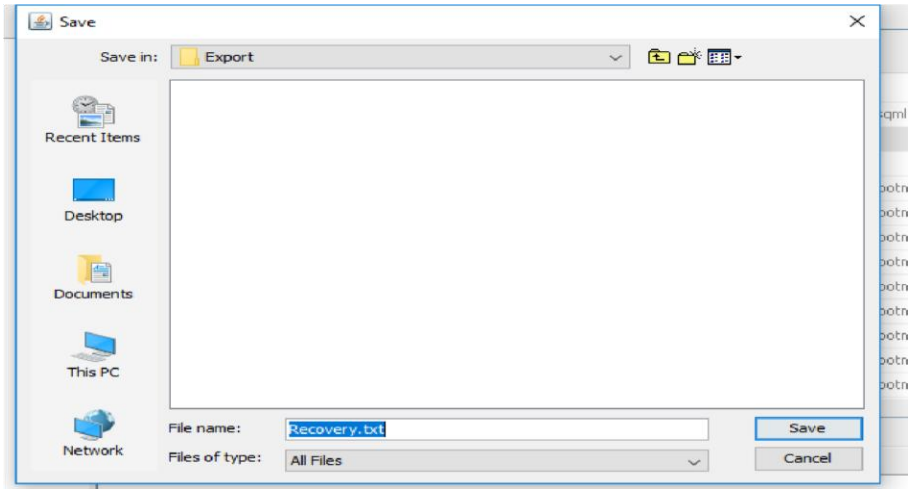
9. From the left pane, click on view option -> Deleted files. In the right pane you will be able to see the list of all the deleted files.



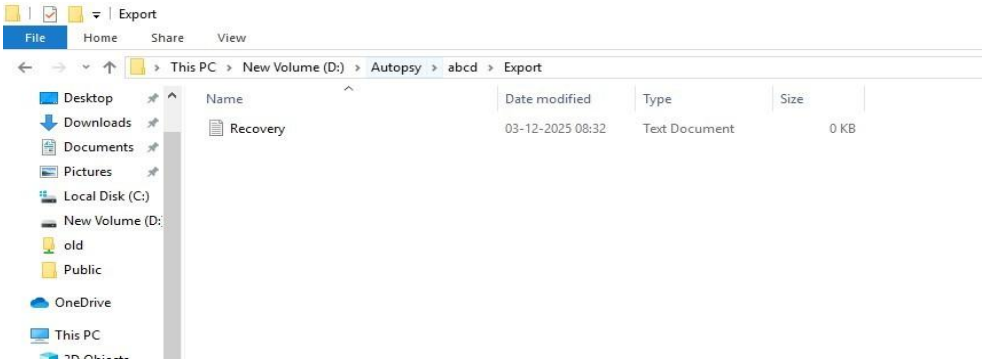
10. Now, right click on any deleted file and click on “Extract Files”.



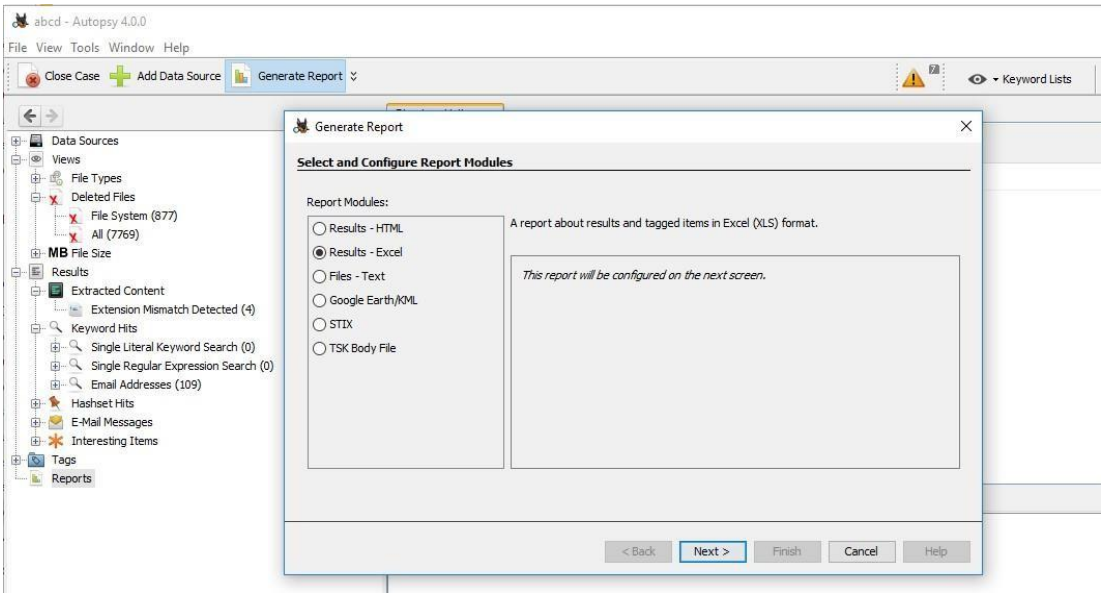
11. After performing the above step a window appears where a folder named “Export” gets automatically created inside your folder which you have already created. Save the extracted file inside this “Export” folder.



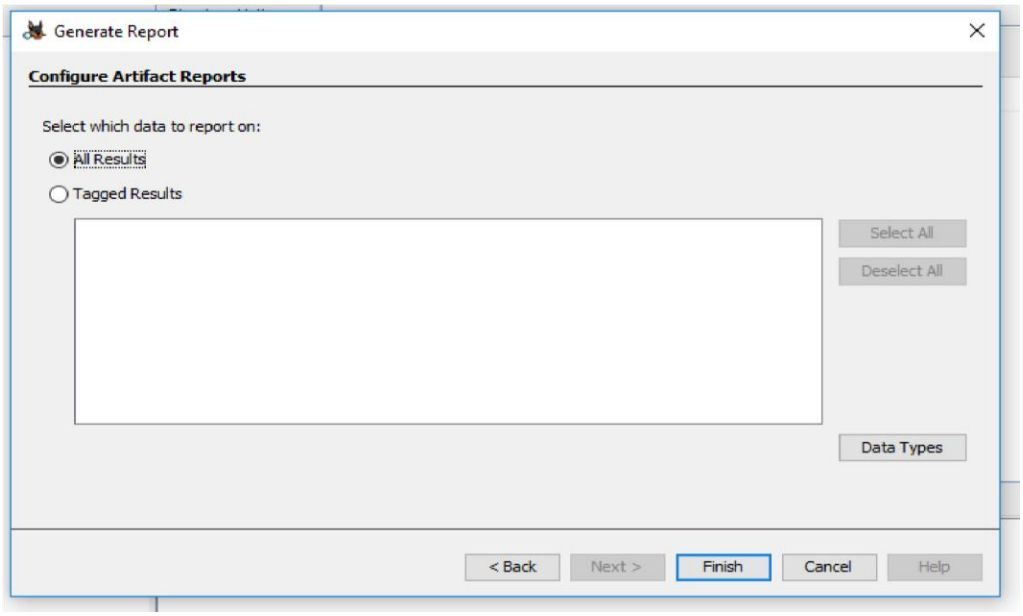
12. Now, check in your folder if the above file has been created.



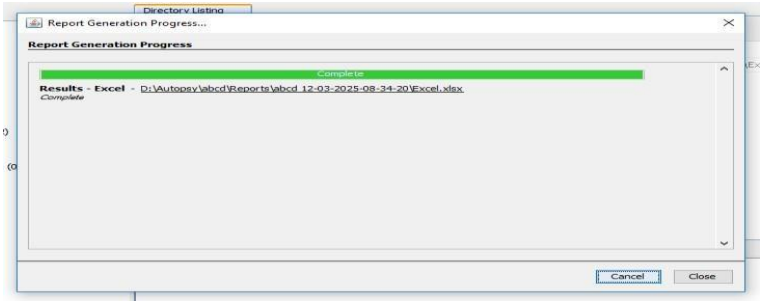
13. Go to Autopsy and click on “Generate Report” in the late pane and select “Results – Excel” option. Click on Next.



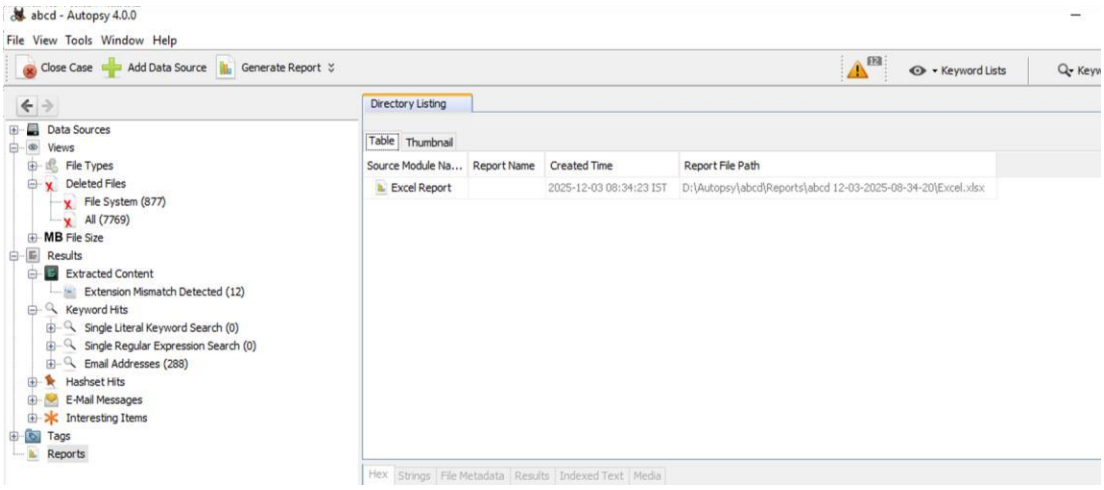
14. The below window appears. Select “All Results” option and click on Finish.



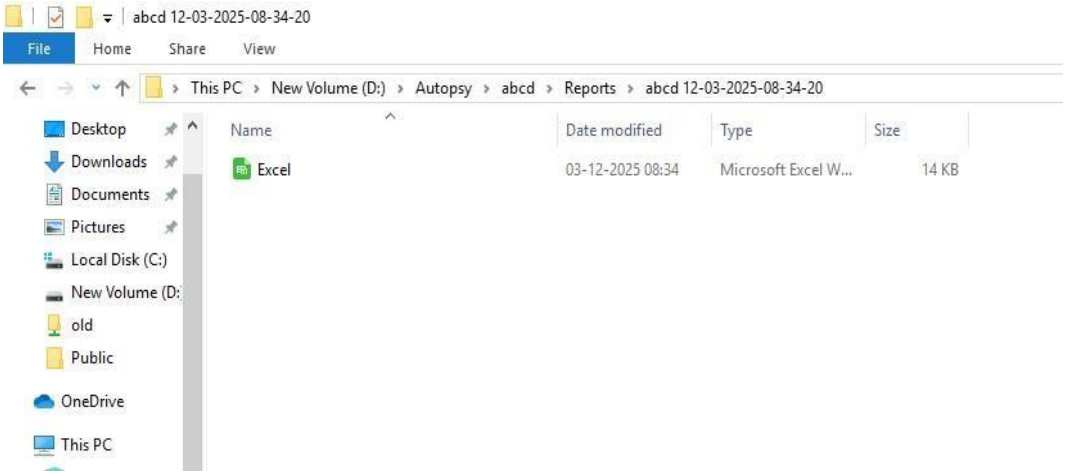
15. You will see the below window.



16. After clicking on the close option you will be able to see the excel file in the right pane.



17. Now, go to file explorer and check if this excel file is created in your folder.



18. Finally, the report with all the required information is created.
